Abstract

Introduction

This protocol utilizes the Y190 yeast strain, that characteristically turns from white to red during growth due to ade- mutation. Baits were subcloned into the pAS1cyh2 vector, and Preys subcloned into pACT2 \(5).

Reagents

Y190 yeast strain YPAD medium 0.1M LiAc \(Sigma) ssDNA \(2.0 mg/ml) PEG 3350 \(Sigma) Sterile H_2O 42 ˚C waterbath SC minus plates \(-LEU, -TRP) SC minus plates \(-LEU, -HIS, -TRP), supplemented with 50 mM 3AT and 20 µg/ml X-gal

Procedure

Transformation **1** Inoculate 10 ml of YPAD medium with a single Y190 colony and incubate overnight at 30 ˚C. 55 ml of fresh YPAD are then cultured overnight to an OD_{600} of 0.3. Cells are then incubated by shaking at 200 RPM and 30 ˚C until they reach an OD_{600} of 0.7. **2** Harvest cells at 2000 RPM for 5 min at room temperature. **3** Aspirate the media, wash cells in sterile water, and spin at 2000 RPM at 25 ˚C for 5 min. **4** Aspirate water and resuspend cells in 1 ml of 0.1 M LiAc and transfer suspension to a fresh microfuge tube. Pellet cells at 6000 RPM for 15 s and aspirate the supernatant. Next, resuspend the pellet in 500 µl of 100 mM LiAc. **5** Boil a 1 ml sample of ssDNA \(2.0 mg/ml) and chill on ice. Mix the yeast cell suspension and transfer 50 µl samples into fresh tubes for the interactions to be tested. **6** Pellet cells at 6000 RPM and aspirate supernatant. **7** Add the following gently over the cell pellet: 240 µl of PEG 3350 \(50% w/v), 36 µl of 1.0 M LiAc, 25 µg of ssDNA \(2.0 mg/ml), and 50 µl sterile water containing plasmid DNA for the interaction screen \(0.1 – 2.0 µg). Vortex mixture until cell pellet is completely mixed into suspension. **8** Incubate the suspension at 30 ˚C for 30 min. Transform the yeast by heat shock at 42 ˚C for 15 min, mix suspension carefully and pellet cells at 6000 RPM for 15 s. **9** Finally, resuspend yeast cells in 200 µl of sterile water for plating. **Plating and selection** **10** Plate yeast onto SC minus plates \(-LEU, -TRP) and grow at 30 ˚C for 3 – 5 days. **11** Streak single colonies onto SC minus plates \(-LEU, -HIS, -TRP) supplemented with 50 mM 3AT and 20 µg/ml X-gal. **12** Yeast are then grown for 3 – 5 days and scored for growth and color change.

Timing

5 d minimum
