

Table 1. Screening tools and their comparators, cognitive outcomes, administration time, sensitivity and specific and conclusions from the literature included in this systematic review.

Reference, Country	Number of studies included in systematic review	Intervention(s)	Comparator	Cognitive outcome(s) measured	Time of administration (minutes)	Sensitivity (%)	Specificity	Conclusions	Abbreviations
Mitchell <i>et.al.</i> , United Kingdom	44	Multidomain screening tests (known as a battery detection method) in primary care which assess for multiple cognitive domains. Primary care casefinding † : • AMTS/MSQ, • MSQ • WIND-SET • PCL • AMTS • PCL Primary care screening ‡ : • PCL • AMTS/MSQ • MSQ • SPMSQ • GPCOG	MMSE	Dementia	<b>Primary care case-finding:</b> • AMTS/MSQ = 4 • MSQ = 2 • WIND-SET = 1 • PCL = 11 • AMTS = 2 • PCL = 11 <b>Primary care screening:</b> • PCL = 11 • AMTS/MSQ = 4 • MSQ = 2 • SPMSQ = 2 • GPCOG = 5 <b>Comparator:</b> • MMSE = 9 with healthy individuals and 15 with patients with dementia.	<b>Battery detection methods:</b> • 84.0 (95% CI 74.2–91.8)	<b>Battery detection methods:</b> • 89.9 (95% CI 78.3–97.4)	The optimal individual tools were the AMTS/MSQ and PCL. AMTS was superior to the MMSE for case finding however the MMSE was optimal for screening.	AMTS/MSQ-Abbreviated Mental Test Score/Mental Status Questionnaire, (WIND-SET)-Specific Set of items from MMSE, PCL-Prueba cognitive de leganes, AMTS-Abbreviated mental test score, GPCOG-General practitioner's assessment of cognition, MMSEMini-Mental State Examination † Case-finding is defined as any tool or questionnaire which identifies a condition with minimal false negatives, measured as the positive predicative value. ‡ Screening is the ability of a test to rule out a diagnosis with minimal false positives, reported as the negative predictive value.
Creavin <i>et al.</i> , United Kingdom	70	• MMSE	A commonly accepted clinical (gold) reference standard.	Dementia	• MMSE=7 with a patient with dementia and 5 with a person with normal cognition	CarneroPardo 2013: • Cut point of 17 = 70 (95% CI 59-80) • Cut point of 24 = 100 (95% CI 95100)	Carnero-Pardo 2013: • Cut point of 17 = 93 (95% CI 89, 96) • Cut point of 24 = 46 (95% CI 40-52)	Carnero-Pardo 2013 reported there were some false negatives as the sensitivity fell from 1.00 (95% CI 0.95 to 1.00) to 0.70 (95% CI 0.59 to 0.80). The summary diagnostic accuracy could not be estimated due to insufficient data.
