Abstract

Abstract: Background: Implantable cardiac defibrillators use has been increasing for the last two decades and they are prone to infections. ICD device infection risk factors are many, some are host related while the others are procedures related. Staphylococcus aureus and staphylococcus epidermidis are accountable for 65 to 75% of the total cases of Implantable cardiac devices infections. Case presentation: A 50 years old male presented to our emergency department with ICD pocket migrated through the skin. The symptoms started over 2 weeks, started as gradual feeling of foreign body moving underneath the skin, associated with mild pain and 3 days before presentation, the ICD penetrated the skin. The patient denied any history of fever, bleeding, pus discharge, palpitations, abnormal shocks or syncope. He was admitted to the hospital, treated for a presumed infection and his ICD device was removed. Conclusion: ICD devices complications are many, including infections. But, to have an infected device protruded through the skin is not a common presentation. We outlined the approach that was taken for this patient and his management in order to enhance the literature in terms of the above mentioned rare presentation.

Case Presentation

A 50 years old male presented to our emergency department with ICD pocket migrated through the skin. The symptoms started over 2 weeks, started as gradual feeling of foreign body moving underneath the skin, associated with mild pain and 3 days before presentation, the ICD penetrated the skin. The patient denied any history of fever, bleeding, pus discharge, palpitations, abnormal shocks or syncope.

Picture

The patient presented in stable condition, vitally stable, upon examination he is conscious and oriented. cardiac examination unremarkable. skin examination shows battery of ICD bulging through skin, no signs of skin infection, other systems unremarkable. His past medical history includes PAD on medical therapy, Ischemic-CMP, STEMI on 2018 PCI to LAD and staging to PDA and RCA done in Kuwait and ICD insertion, diabetes mellitus and hypertension. The past surgical history was positive for PCI and ICD insertion.

Hospital course

Initial labs and ECG at emergency department shows Hemoglobin 122, No leukocytosis, Creatinine 173, hyperkalemia 5.8.

- **ECG interpretation shows:** Sinus rhythm at rate 69 bpm, with 1st degree A-V block Anterolateral infarct, age undetermined.

Cardiology team admitted the patient as a case of ICD pocket infection and migration. Septic workup including wound culture sent. Started on ceftazidime and vancomycin as per ID recommendation. Septic and wound culture came back negative.

- **Underwent Transesophageal echocardiogram (TEE) to rule out IE which showed:**

The left ventricle is mildly dilated.

Left ventricular systolic function is moderately reduced. Ejection fraction = 35-40% LV Filling pressure Raised

There are regional wall motion abnormalities as specified c/w LAD territory infarct.

The right ventricle is normal in size and function.
The left atrium is moderately dilated.
There is mild to moderate mitral regurgitation.
There is mild tricuspid regurgitation.
Right ventricular systolic pressure is elevated at 40-50mmHg.
Mild atherosclerotic plaque(s) in the aortic arch.
There is no pericardial effusion.

Underwent ICD removal on 31/12/2020 successfully

Intra-operative TEE showed:
There is large and mobile thrombus noted on the atrial segment of the pacer wire.
No thrombus is detected in the left atrium or atrial appendage.
There is no evidence of vegetation’s on cardiac valves.
There is no pericardial effusion.
Underwent another ICD implantation on 13/01/2021, was discharged on stable condition after.

Overview
Implantable cardiac devices use has been increasing for the last two decades. This term include pacemakers, implanted cardiac defibrillators, cardiac resynchronization therapy devices.

Risk factors
ICD device infection risk factors are many, some are host related while the others are procedures related. End stage renal disease, malignancy and diabetes are some of the host related risk factors. While procedure duration, revision or use of temporary pacing before the procedure can also increase the risk of infection.

Epidemiology
Staphylococcus aureus and staphylococcus epidermidis are accountable for 65 to 75% of the total cases of implantable cardiac devices infections. Incidence of Implantable cardiac defibrillator (ICD) infections is around 1.9% in a lifetime. Where the risk differs for other cardiac devices such as pacemakers 1.2%, where it reaches up to 3.4% for Cardiac resynchronization therapy devices.¹

Management
Implantable cardiac devices infections can cause systemic or pocket infections. Endocarditis with bacteremia is a common systemic manifestation while pain, purulent discharge or erosion through the skin are manifestations of pocket
infection. The patient management should include bacterial and fungal infection coverage. Also the infected device must be removed with the reinsertion of the new device to be inserted through an uninfected route.\textsuperscript{2}

**Declarations**

Ethics approval and consent to participate:

- The project was submitted to Research Approval Committee (RAC) committee in the research center in King Faisal Specialist Hospital & Research Centre.
- certify that the study was performed in accordance with the ethical standards as laid down in the 1964 Declaration of Helsinki and its later amendments or comparable ethical standards.
- Written Informed consent was obtained from the patient for participation in the study and case publication.

Consent for publication:

- Written Informed consent was obtained from the patient for participation in the study and case publication.

Availability of data and materials:

- The Data that support the findings of this study are available from the corresponding author upon reasonable request.

Competing interests:

- The authors declare that they have no conflict of interest.

Funding

- This case report/authors received no specific grant from any funding agency in the public, commercial or not-for-profit sectors.

Authors' contributions:

- All authors contributed to the study conception and design. Material preparation, data collection and analysis were performed by Abdulaziz Alrajhi, Mohammed Alsultan, Lama Alotaibi and Ahmed Alshudukhi. The first draft of the manuscript was written by Abdulaziz Alrajhi, Mohammed Alsultan, Lama Alotaibi and Ahmed Alshudukhi and all authors commented on previous versions of the manuscript. All authors read and approved the final manuscript.

Acknowledgements:

- Not applicable.
