Figure S3

Figure S3. Correlations between the frequencies of intrasplenic follicular dendritic cells (FDCs) and T cell subsets in patients who underwent splenectomy due to HBV-related liver cirrhosis-induced hypersplenism. Splenic tissues were obtained from patients who underwent splenectomy due to HBV-related liver cirrhosis-induced hypersplenism ($n = 6$) and intrasplenic mononuclear cells were isolated, the correlations between the frequencies of intrasplenic FDCs and CXCR5⁺CD4⁺ T cells and CXCR5⁺CD8⁺ T cells were analyzed. Spearman rank correlation test.
